Your guide to MuniAlert

Know what to do.
Report with confidence.

Learn the features, try a highlighted walkthrough, or find step-by-step instructions.

Gabay sa pag-uulat, lokasyon at pagsubaybay ng insidente.

Immediate danger? Call emergency services first.
An app report is a record for municipal review. It does not guarantee emergency dispatch. Use only approved local hotlines.

Feature guide & user manual

Step-by-step user manual

Open a topic or search for what you need.

Get immediate help before reporting

Search agency contacts, then continue online if you cannot call.

1. Report a hazard first asks whether someone needs immediate assistance. Choose Yes for an accident, serious injury, fire or person in danger; choose No for the normal reporting flow.
2. On Yes, search by agency, service, phone number or area. Show closest agencies asks permission and sorts contacts with saved coordinates by straight-line distance, not travel time or availability. Without location permission, search still works.
3. Use a call button if possible. No cellular load or unable to call? Continue to report online remains available; the app needs internet and does not guarantee immediate dispatch. Ask someone nearby to call when safe.
4. After sign-in, submit safe photos and a confirmed incident location. Your assistance request is highlighted privately to staff. It does not certify the report or call an agency automatically.

Open a report from a notification

The bell opens your private updates without a sidebar page.

1. Open the bell, or Updates in the mobile dock. Sign in if prompted. Notifications is no longer a sidebar destination.
2. Select an item to open its report in My reports or the administrator review queue. Only that item becomes read. Mark all read is available separately.
3. Unavailable or unauthorized reports stay protected and show a message. Never assume a notification means an emergency team was dispatched.
4. The highlighted Help tour is a floating button in the bottom-right above the phone dock. Close or Escape returns focus to it. The searchable manual remains in Settings.

Read validation messages and show a password

One clear message and a show/hide button for each password.

1. If a field needs attention, read the Please check toast. Required fields still prevent submission. Go to field returns you to the highlighted field; correct it and retry. Validation messages stay available until corrected, cleared or dismissed.
2. Use Show password beside a password input to check what you typed, then Hide password to mask it again. Each password field has its own control. Toggling visibility does not save or submit the form.
3. Password visibility starts off, is not remembered and is hidden when the page goes into the background. Password rules and administrator authenticator verification still apply.

Understand which reports are visible

Your submissions are private; accepted hazards and published news are separate.

1. Dashboard and Hazard map show incidents fact-checked and accepted by the municipality. The separate Verified hazards menu was removed to avoid repeating these views. Other members cannot browse your pending, rejected or unreviewed submissions.
2. Open My reports to follow all your undeleted submissions: Submitted, Under verification, Verified, Assigned, Responding, Resolved, Closed and Rejected. Use All statuses to see everything, or filter by a status. Only you and authorized municipal administrators can see original evidence, exact locations and private response notes.
3. Verified news contains posts an administrator explicitly published after accepting the incident. Read the reviewed update, submitter credit and Incident details. A name may be withheld for safety. Share the public post using Share, Facebook, X, WhatsApp or Copy link.

Build your hazard achievement collection

Creative milestones in ten hazard categories.

1. Open My profile and find Hazard achievement collection. Each category has three milestones at 1, 5 and 15 accepted reports, with its own names, icons and progress.
2. Your own fact-checked, accepted report counts once in its category. Pending, rejected, deleted and other members reports and confirmation taps do not add progress. Publishing a post does not add extra credit.
3. Explore three milestones to see earned and upcoming badges. Fire includes Firewatch Scout, Flame Sentinel and Firewatch Beacon; streetlights include Light Finder, Nightwatch Guide and Beacon Keeper.
4. Your collection is private to your account. Rejected or withdrawn eligible records can change progress. Stay at a safe distance; do not approach danger for an achievement. Cash and gift fulfillment is a separate municipal decision.

Stay signed in on this device

Close and reopen without signing in again.

1. Once you finish signing in, closing the browser or Android app does not sign you out. Reopen MuniAlert on the same device to continue. Keep browser cookies and app storage to retain the saved login.
2. To leave a shared device, choose Sign out and confirm. This signs out that device. Password resets, suspension and other security changes can also revoke saved access.
3. Administrators may still need a fresh password and authenticator code before sensitive changes. Reopening the app does not grant fresh verification for an administrative action.

Protect and recover your account

Authenticator codes, verified email and municipal support.

1. Administrators need an operator-approved enrollment window before initial authenticator setup. Sign in, scan the private QR code or enter the setup key in your authenticator, then verify a fresh code.
2. Save the ten recovery codes privately outside the phone. Each authenticator time step and recovery code works once. If a code was already used, wait for the next code. Never include these values in a report, comment or support screenshot.
3. Sensitive administrative changes may ask for your password and authenticator or recovery code again. Your pending edit is kept; cancelling verification does not save it. Verification lasts five minutes on the current session/device.
4. Settings → Account security & email shows the unused recovery-code count and allows replacing codes after verification. Replacing codes revokes other credentials.
5. When municipal email delivery is enabled, verify your local account email from Settings → Account security & email. Enable Report update emails there to receive references and status changes for your own reports. Forgot your password? requests a single-use 30-minute link for an eligible verified account. A provider email assertion is separate; provider-only accounts use their provider recovery process.
6. Forgot your password? Choose Send email reset link for a previously verified deliverable email, or Use recovery code with a code saved from Settings. Codes work once and can also replace an authenticator code; save them before losing access.
7. A password reset revokes prior credentials and still requires administrator MFA. If your phone and recovery codes are lost, use the approved municipal support process. Email/scanner/hosting and physical-device acceptance are separate from source implementation.

Make text easier to read

Text size, contrast, spacing, motion and action messages.

1. Open Settings from the header or navigation (More → Settings on a phone), then Reading and accessibility settings. The user guide is also in Settings. You do not need to sign in to read the guide or adjust text.
2. Drag the Text size slider from 100% to 200%. The preview changes while you drag; release to apply it to the app. Use minus/plus or keyboard arrow keys for 5% steps. Bold text, High contrast and More reading space can be used together.
3. Enable Reduce motion to stop decorative animations and show final counts immediately. Your device reduced-motion preference is always respected.
4. Enable Keep messages visible if you need more time to read. Otherwise, success and information messages close after eight seconds, pausing while focused or hovered. Errors wait until dismissed.
5. Action messages use an icon and words to describe success, information or an error. Read the error beside the form as well, correct the problem and try again. A download message means a file was prepared, not that it was saved to your phone.
6. Signed-in preferences are saved separately to your account and restored on other devices after sign-in. Guest preferences stay on this device. A sync error keeps your local changes and offers Retry saving preferences in Settings. Reset reading settings restores the defaults. Browser zoom and phone text settings remain available.

Sign in and find your way around

Your account, navigation and the preview workspace.

1. Use Sign in or the account button. Create a citizen account with your name, email and password. Google and Facebook sign-in buttons are currently hidden; use your email and password.
2. On a phone, use Home, Map, Report, Updates and More. More opens the complete navigation, including this guide. Administrator navigation shows Review and Manage instead of citizen reporting.
3. In a popup, scroll the middle to read all fields or details. The title, close button and bottom actions stay visible. Use Go back to cancel a confirmation without losing the form underneath.
4. A Demo workspace banner means the records are fictional. Exit preview before sending a real report. A report is accepted only when the system returns a reference number.
5. Stay signed in on your own device. Use Sign out on shared devices; clearing app data, revocation or session expiry requires a new sign-in.

Send a report with photos

A category, safe evidence and a clear description.

1. If anyone is in immediate danger, call an approved emergency hotline first. Do not wait to finish this form or take photographs.
2. Tap Report a hazard and choose the incident category, such as Road accident, Flooding, Fire or Fallen tree.
3. Take or add one to three safe incident photos. The app prepares each photo to fit the upload limits. Avoid faces, visible injuries, personal documents and other identifying details.
4. Choose and confirm the incident location, then choose one of Basista's 13 covered barangays and enter the street or landmark. The location section below explains GPS and manual entry.
5. Enter a clear title and description. Supply incident time only if known. Choose whether injuries are observed, or Not sure / Hindi tiyak. Enter people affected only as an optional estimate; leave unknown values blank.
6. Review any similar reports, then submit and confirm. Wait for a reference number. Open My reports to follow the saved record.

> Submitting an app report does not guarantee emergency dispatch. Stay safe and contact emergency services directly when needed.

Make the map clearer

Map styles, Basista boundaries and hazard-type filters.

1. Choose Clear for fewer details, Streets for more roads and landmarks, or Dark for a darker background. The selected map style and boundary switches are remembered on this device.
2. Open Boundaries and choose Barangays, Cities / municipalities or Provinces. The local layer names the 13 covered Basista barangays. City outlines provide Basista and nearby context; the province outline is Pangasinan. These published reference boundaries do not establish official jurisdiction.
3. Use Show hazard type beside the map to show only Fire, Road accident, Flooding or another category. The selector shares the report filter. Show all hazard types clears this category choice; existing status/search filters still apply.
4. Basista area returns to the service-area view. Fit reports brings the current report page into view. A report count and, when needed, map-page controls show which matching records are loaded.
5. Zoom in to read small area labels. Pins, original GPS and confirmed incident locations stay in place when changing map style. A map/network error offers Retry map or Use Streets; it does not confirm a report submission.

Confirm the incident location

Use phone GPS, adjust the pin or enter a location manually.

1. Choose Use current location and allow location access if you want to use your phone GPS. Check the accuracy shown; your current position may be different from the incident location.
2. Choose Adjust pin when the incident is elsewhere. Tap the map or move the pin, then check the barangay and nearby landmarks.
3. If GPS is denied or unavailable, choose Choose location on map. Tap or drag the incident pin, or pan the map and use Place pin at map center. Raw coordinates are hidden in the community report form.
4. Tap Confirm location. Changing the pin clears that confirmation, so confirm again before submitting. Original phone GPS, the selected incident pin and later verified location are kept separately.

> A public map marker is an approximate area. Use the private report details for a precise incident location.

Check a similar nearby report

Help the municipality avoid duplicate incident records.

1. When a recent similar accepted hazard is nearby, the form shows a suggestion before submission. Other members pending submissions remain private.
2. If it is the same incident, choose Same hazard to record your confirmation. This does not submit another incident report.
3. If it is a separate incident, select This is a different hazard; submit a new report, then continue.

Track updates and resolution

Your reference, timeline, notifications and resolution photos.

1. Open My reports and select your report. Its timeline shows municipal status changes and response notes.
2. The usual stages are Submitted, Under verification, Verified, Assigned, Responding, Resolved and Closed. Rejected reports include a municipal note. A saved report or a verified status does not itself guarantee dispatch.
3. Incident photos and resolution photos are shown as separate private groups. Response notes explain action taken; only the reporter and authorized administrators can view private details.
4. Open the bell or mobile Updates for your notification dialog. Select an update to open its related private report. Enable push if offered; delivery depends on permission, connectivity and the municipality enabling the service. The inbox remains the place to check saved updates.
5. Only your own unverified report can be deleted from the interface. Deletion removes its listing; retention and records handling remain the municipality's responsibility.

Understand what stays private

Original evidence and exact incident details are protected.

1. Original report titles and descriptions, precise landmarks and coordinates, injury observations, private account/contact information, incident photos and resolution photos are private to the reporter and authorized municipal administrators. Published news can credit your display name and show reviewed incident details; an administrator may withhold your name for safety.
2. Community maps show only fact-checked, accepted incidents in approximate areas. Public news requires a separate published title and summary reviewed by an administrator. Verifying a report does not automatically publish its original description or images.
3. Comments on public news show the commenter's account name and text. Do not post victim names, injury details, contact information or other private records in comments.
4. There is no automatic face blurring or automatic removal of personal information. Avoid collecting unnecessary identifying details, even in private evidence.

Fix common reporting problems

Connection, GPS, photo, map and account recovery steps.

1. No connection: keep the form open and retry when connected. Do not assume a report was accepted without a reference number. Unsent forms are not automatically saved or submitted in the background.
2. GPS denied or inaccurate: use a manual pin or known coordinates and confirm the incident location. If map tiles do not load, use available coordinate fields and an accurate landmark.
3. Photo error: choose JPEG, PNG or WebP, wait for preparation and try a smaller image if needed. You can attach up to three incident photos, each prepared to at most 1 MB and 1920 pixels.
4. Session expired: sign in again. Disabled Google or Facebook buttons mean the municipality has not enabled that provider; use an available sign-in method.
5. No push alert: check Notifications and your phone permissions. Push is optional and its availability depends on the municipality enabling it.

MuniAlert · Emergency & Public Hazard Reporting

Municipal Emergency and Public Hazard Reporting System with Photo and Location-Based Incident Tracking
